

# SENSE PRO LICENCE

## SP-BASE

### DESCRIPTION

VDG Sense Pro is for large organizations and complex video security environments. VDG Sense Pro offers a complete video security solution. The Pro license includes all innovative functionalities and has no limit on the amount of servers and video channels.

### FEATURES

---

Multi server deployment

---

Unlimited slave servers supported

---

500 video channels per server supported\*

---

500 external I/O channels per server (incl.)

---

256 simultaneous client connections per server (incl.) Optional

---

VDG Sense Pro also offers the possibility for intelligent video analytics like license plate recognition, object recognition, face detection and scene analysing. Moreover, failover management is possible to ensures the reliability and availability of the your entire system.

Optional expansions:

- Virtualization license
- Server add-ons
- Management server add-ons
- Pro video channel add-ons

| Video                        |   |
|------------------------------|---|
| Codec                        | Supports MJPEG, MPEG-2, MPEG-4, H.264, H.265, and MxPEG for analog and IP cameras.  |
| Panels                       | Live viewing, playback, floor plans / maps, on-screen PTZ control, events, customizable buttons, HTML browser, clock and more.  |
| Recording                    | Continuous or motion / event triggered recording. Can be scheduled using the calendar feature for repetitive action.  |
| Screen layout and video wall | Create layouts through virtual matrix structure or using custom settings. A screen layout can be directed to any monitor as a default setting, manual selection, or as the result of a macro. Different layouts can be combined. The display of multiple screens can be activated by a single operator action or alarm input. |
| ONVIF                        | VDG Sense is ONVIF Profile S compliant, allowing a plug-and-play integration of ONVIF capable devices supporting audio & video streaming, PTZ control and relay outputs.  |
| Clients                      |   |
| VDG Sense Client             | A dedicated desktop application that provides operators with full control of the VDG Sense video security system.   |
| Mobile applications          | For iOS and Android devices there is a VDG Sense app available. Through the mobile app it is possible for users to view and control their VDG Sense video security system from their mobile device such as a smartphone or tablet.  |
| Web client                   | Allows authorized users remote access to their VDG Sense video security system via a standard Internet browser.   |
| Features                     |   |
| Event driven macros          | Event driven macros are pre-defined rules of actions that define the system's behavior, triggered by one or more events.  |
| Dewarping                    | Dewarping allows the user to cover a wide area with a single device, such as a fisheye lens or 360 camera, and to have a "normal" view of an otherwise distorted or reversed image.   |
| Dual streaming               | Dual streaming provides live streaming video in standard quality, and recorded video in high resolution and vice versa. Compared to a standard CCTV environment, where streaming video and recorded video are the same quality, a much smaller demand is placed on the network capacity.                                      |
| Multicasting                 | With Multicasting, network loads are reduced up to 30% compared to conventional streaming video to multiple clients.  |
| Picture and video export     | Still images are time-stamped and exported to a PDF format.<br>A video clip with a selected start and end time from one or more cameras can be exported simultaneously.<br>All video material can be exported to a network location or portable device.   |
| Log files                    | All events, macros, changes, and specific user activities are logged in the database.   |
| Profiles                     | Profiles comprise user settings and macro commands. Profiles describe the behavior of all connected devices through predefined time frames and / or situations. Profiles can be (de)activated through the calendar function, external XML commands, internal macro commands, user events, and I/O contacts.                   |
| User management              | User management can only be performed by an administrator;<br>administrators can grant multilevel access to users among all predefined objects in the system.   |

# Specs

## Features

|            |   |
|------------|---|
| Calendar   | Used to (de)activate profiles and run automated macros within specified periods.  |
| Statistics | Generated for devices, hard disks, and network in real time to assist support engineers, technicians, and network managers. |

## Add-ons

|                     |   |
|---------------------|---|
| Failover management | The failover server ensures the reliability and availability of the entire system.<br>If no response is received from one of the VDG Sense servers, the failover server takes over the settings and functionality of that server. |
|---------------------|---|

## Intelligence add-ons

|         |   |
|---------|---|
| CarR    | For license plate recognition. A highly intelligent feature developed to scan for license plates in a live video stream.  |
| ObjectR | ObjectR is intelligence that isolates objects from video images and classifies them into several categories, each containing pre-defined rules.<br>When rules are violated, events are created that can trigger macros or define system settings.<br>Metadata points are placed on eyebrows, eyes, nose and mouth.<br>The detected face can be compared with the person lists (e.g. a black- or white list).<br>With a match or mismatch an event can be created and actions can be triggered using macros. |
| SceneR  | SceneR has been developed to detect camera tampering and can analyze video images on change of angle and / or loss of detail.   |

## Server minimum system requirements

|                        |   |
|------------------------|---|
| Processor              | Intel Xeon or Intel Core i5 Processor @3.0GHz,            |
| Internal memory        | 8GB   |
| Network interface card | 1000 Mbps (or 1 Gbps)                                     |
| Operating system       | Windows server 2022/2025, Windows 10 (64 bit), Windows 11 |

## Client minimum system requirements

|                        |  |
|------------------------|--|
| Processor              | Intel Core i3 or i5, @3.00GHz                                    |
| Memory                 | 8GB  |
| Graphics card          | iGPU or a recommended dedicated GPU when using multiple monitors |
| Network interface card | 1000 Mbps (or 1 Gbps)  |
| Audio                  | Standard audio card  |
| Operating system       | Windows 10 (64 bit) or higher                                    |
