SENSE FAILOVER LICENSE

SP-FAILO

DESCRIPTION

System failure is not an option when your safety depends on it. With our failover add-on, we ensure redundancy is guaranteed if a server failure is detected. With this add-on, a 'Failover' server, or 'Hot Standby' server is used to monitor one or more servers in the same installation. The Failover server actively checks if the monitored servers are still functioning. When it detects a server is not responding, it will automatically take-over the server using the same settings of the 'failed' server, thus emulating its configuration. When the original server is back online, the failover server will shutdown automatically.
